An introduction to Rust

Foreword

This session is somewhat a bias introduction from me because I love <code>rust</code>. Here is the backstory: I was first introduced to <code>rust</code> in 2022, mostly because of the <code>controversy</code> around it, and I did part of the <code>advent-of-code</code> (AOC) in rust. At the time, I could not see much point of learning and using <code>rust</code>, mostly because I do not know where to use <code>rust</code>. I went on a year without using and following <code>rust</code>, then I did most of AOC 2023 in <code>julia</code>. On December 24, 2023, I came across an article about web assembly (<code>wasm</code>), which talks about how <code>wasm</code> can be used to distribute code on the web which run on client-side with almost native performance, and how one of the main use case for <code>rust</code> is to compile to <code>wasm</code>. I unfortunately and willingly sacrifice my 25th day of AOC to learn about <code>rust</code> and <code>wasm</code>, and it was awesome. For the next couple of months I was exploring <code>rust</code> a lot, and it was such a fun experience.

In case you do not realize how interesting it is, let me break it down for you. If you have supervised students or collaborate with others on a code project before, especially with someone using a MacOS, the most difficult part of the job could be getting them to install the dependencies correctly. Nowaday most python package can be install with <code>pip install [package]</code>, but sometimes people need to build a package dependencies from source, and that is a highway to nightmare if the code is not supported by a huge community. Being able to write in a programming language like <code>rust</code>, compile it to <code>wasm</code> and run it directly on a browser without any installation is a complete game changer. No install needed, just open the browser and boom, the code runs. Say in a dire situation like needing to factor some prime numbers in a party, you can just pull out your phone, open the browser and check whether a number is a prime. Isn't that cool?

Beside, I really had a great time coding rust in general. It takes some time to get used to the language, but once you are more familiar with rust, it is a great language to go hard core with. In this lab, we are going to go through the following topics:
